

LAZYLAWN®

Fitting guide

Real grass replacement in 10 easy steps ...

1. Remove the turf to a depth of 2" using a turf cutter (pic B).
2. Where there is not an edge or a wall to butt grass up to, install the Everedge steel edging system or fix tanilised timber battens around perimeter using wooden stakes to secure to create a boundary.
3. Prepare the ground, i.e. remove humps and bumps leaving natural falls. Should the area have drainage problems, we recommend a type 1 stone base and possibly soak-aways are installed.
4. Chamfer the outer perimeters to a drop of 40mm from edging height. This allows the grass to run neatly into the edging system or edge, creating a more natural look.
5. Once area has been levelled, install 10-15mm depth of 6mm to dust granite stone (damp) or alternatively sharp sand to max depth of 15mm.
6. Use a wooden bar to level the area (pic C). This gives you a flat even surface. Once complete, using a plasterers float cleanly chamfer the stone or sand into the edging system.
7. Once level use a compactor plate to compact.
8. Cover the area with a weed membrane to discourage weed growth (pic D). Stretch out taught and nail in position using 4" galvanised nails every 0.75 metres. Trim excess to fit.
9. Unroll the LazyLawn and ensure it is level (no ripples) and cut into the boundary.
10. When fully fixed, the whole area should be sand dressed with kiln dry sand to a maximum weight of 8 kg's p/sqm. Installation should only be carried out whilst weather is dry. Should the LazyLawn get wet, this will cause a problem when installing the sand. Use a stiff brush to apply sand. Finished result see pic E.

Using the Join Tape and Glue ...

1. Unroll the two surfaces face up that require joining and ensure they are running in the same direction. Butt the two pieces together, then fold the LazyLawn over on itself by 30cm (12").
2. Using a straight edge trim each join edge by approx 3 tufts ensuring not to cut into the tufts.
3. Lay the joining tape through the centre of the join, shiny side down.
4. Apply a bead of adhesive, approx 1/2" down the length of the joining edge of the grass. Repeat another bead approx 2" behind this one in a wave pattern. Fold this side of LazyLawn over onto joining tape.
5. Repeat this action on opposite side.
6. To complete the seam, you need 2 operatives. First operative needs to glide the carpet in at the start whilst the 2nd operative ensures the carpet does not flop over and crush or contaminate the tufts on the opposite side as this will give an imperfect seam. Once the first section of the carpet has been glided in, the 2 edges need to be brought together ensuring no tufts are damaged or buried. Once complete, check that there is only a 1mm gap maximum between the 2 sides.

Permanent installation onto concrete or similar:

1. Remove all debris and dust. The concrete should be reasonably smooth and dry, and ideally have a fall to help disperse rain water. If there is no fall, it is recommended that a few drainage holes are made in the concrete.
2. It is also an option to use underlay on the surface. This helps reduce any imperfections in the sub floor and also acts as a shock pad (pic 1).
3. Fix the surface with a recommended adhesive - Apollo or Lazy Fix (pic 2). It is not always necessary to glue the artificial lawn to the concrete if using a sand filled grass, however we do recommend the perimeters are fixed down.
4. Sand dress the surface whilst dry, with kiln dry sand @ 6-8 kg's p/sqm. This will discourage the pile from flattening, prolonging the life of the product. (pic 3 - outdoor only).

Roof Gardens:

1. Before any work is started, check to ensure that the roof area is waterproof and in good condition. Clean the area with a good brush and clear away dirt.
2. We always recommend an underlay to be laid over the area. This provides a protective layer for the roof. It is also used to enable the artificial grass to be fixed to the underlay and not the roof surface.
3. (Optional) Fix bull nose trims to perimeters where there are no boundaries. Never run the lawn up the flashings.
4. Lay the grass applying a small amount of adhesive around the perimeter. Cut the grass into the trims and up to the boundaries.
5. Sand fill grass with kiln dry sand, (6-8 kg's p/sqm). This should be carried out whilst weather conditions are dry to allow the sand to filter into the pile. Use a stiff brush to apply.

*Please note - Artificial grass can only be glued directly onto smooth concrete surfaces. For all other surfaces (i.e. slabs, decking) a rubber underlay is highly recommended.

These instructions have been written to limit the amount of specialist equipment you would have to hire to complete the job on a DIY level. All LazyLawn installation teams use top quality installation equipment (inc. mechanical brushes etc) to ensure the installation is to the very highest standard.

Temporary installation:

The surface can be taped down with double sided tape or loose laid and kept down with garden furniture or flower pots. Also on ply/mdf areas it may be stapled down. Always ensure that the surface is fixed down adequately to guard against the wind.

If you have any fitting queries, please contact our sales office prior to ordering.

Visit www.youtube.com/lazylawn for more fitting info and advice.

When trimming against a wall use the back edge of a knife. Push the excess into the corner, then trim off the wastage.
